

River Modelling

Assignment 1: Calibration / Validation Unsteady Model

Modelling Process

Typical Modelling Steps

- data collection and pre-analysis and -processing
- model set-up (unsteady model)
- **model calibration**
- model validation
- model application
- data post-processing
-

Model Calibration and Verification

Work Steps

- **calibration:** model optimization by changing parameters for a specific simulation scenario
- specification of calibration parameters and their ranges
- specification of the target function to be optimized
 - > **model evaluation**
- specification of an optimization strategy
- model **verification** with calibrated model for a simulation scenario not used for calibration
 - > **model evaluation**

Model Calibration

Specific Simulation Scenario

different flood scenarios (examples)

- HQ10 -> 9470 m³/s -> ~ Nov 1998
- HQ50 -> 11500 m³/s -> ~ Jan 1995

different models (options)

- Mike11
- HEC-RAS

different geometry resolution (options)

- e.g. 100 m, 500 m, 2500 m, selected cross-sections

different roughness coefficients (main parameter)

- one Manning/Strickler value for the river section -> range: ~25-40
- different values for river bed and flood plains -> several values

Model Evaluation

Quantitative Evaluation of a Model

- specification of an objective function
- reference model/data:
 - measurements
 - (other) model results
 - target values
 - ...
- quantifying with mathematical coefficients
relationship simulation model <-> reference

Model Evaluation

Examples or Evaluation Coefficients

- error index
 - Root Mean Square Error (RMSE)
 - Percent bias (PBIAS)
- standard regression
 - Pearson's correlation coefficient (r)
 - Coefficient of determination (R^2)
- dimensionless evaluation
 - Nash-Sutcliffe efficiency (NSE)

Model Evaluation Coefficients

Root Mean Square Error (RMSE)

standard deviation of the residuals/errors

$$\bullet \text{ RMSE} = \sqrt{\frac{\sum_{i=1}^n (V_i^{obs} - V_i^{sim})^2}{n}} \quad \text{coefficient } \geq 0$$

Percent Bias (PBIAS)

average tendency of the simulated data to be larger or smaller than their observed counterparts

$$\bullet \text{ PBIAS} = \frac{100 \times \sum_{i=1}^n (V_i^{obs} - V_i^{sim})}{\sum_{i=1}^n V_i^{obs}}$$

Model Evaluation Coefficients

Pearson's correlation coefficient (r)

linear correlation between observed values and simulated values

$$\bullet \quad r = \frac{\sum_{i=1}^n (V_i^{obs} - V_{mean}^{obs})(V_i^{sim} - V_{mean}^{sim})}{\sqrt{\sum_{i=1}^n (V_i^{obs} - V_{mean}^{obs})^2} \sqrt{\sum_{i=1}^n (V_i^{sim} - V_{mean}^{sim})^2}} \quad \text{coefficient: } -1 \leq r \leq 1$$

$\pm 0.5 < r \leq \pm 1.0$ high correlation

$\pm 0.3 < r \leq \pm 0.5$ medium correlation

$\pm 0.1 < r \leq \pm 0.3$ low correlation

$r = 0.0$ no correlation

$r = \pm 1.0$ perfect linear relationship

Coefficient of determination $R^2 = r^2$

Model Evaluation Coefficients

Nash-Sutcliffe efficiency (NSE)

relative magnitude of the residual variance compared to the measured data variance

$$\bullet \quad NSE = 1 - \frac{\sum_{i=1}^n (V_i^{obs} - V_i^{sim})^2}{\sum_{i=1}^n (V_i^{obs} - V_{mean}^{obs})^2} \quad \text{coefficient: } 0 \leq NSE \leq 1$$

$0.75 < NSE \leq 1.00$	very good
$0.65 < NSE \leq 0.75$	good
$0.50 < NSE \leq 0.65$	satisfactory
$NSE \leq 0.5$	unsatisfactory

Model Calibration

Strategy Model Calibration

Calibration Parameter: roughness coefficient (Manning/Strickler Value)

1. unsteady simulation model setup
2. choice of roughness coefficient
3. simulation run -> simulation result file
4. model evaluation (R Script -> result file -> evaluation criteria)
5. model calibration sufficient -> yes -> stop
6. iteration to 2. by updating the roughness coefficient
 - > bisection method / interval halving method
 - > other searching functions

Model Calibration

Example Mike11 – Batch Simulation

BatchSimulation

Base simulation file: Rhine_Simulation.sim11 ... Number of simulations: 6 Verify Run

Available parameters: Selected parameters:

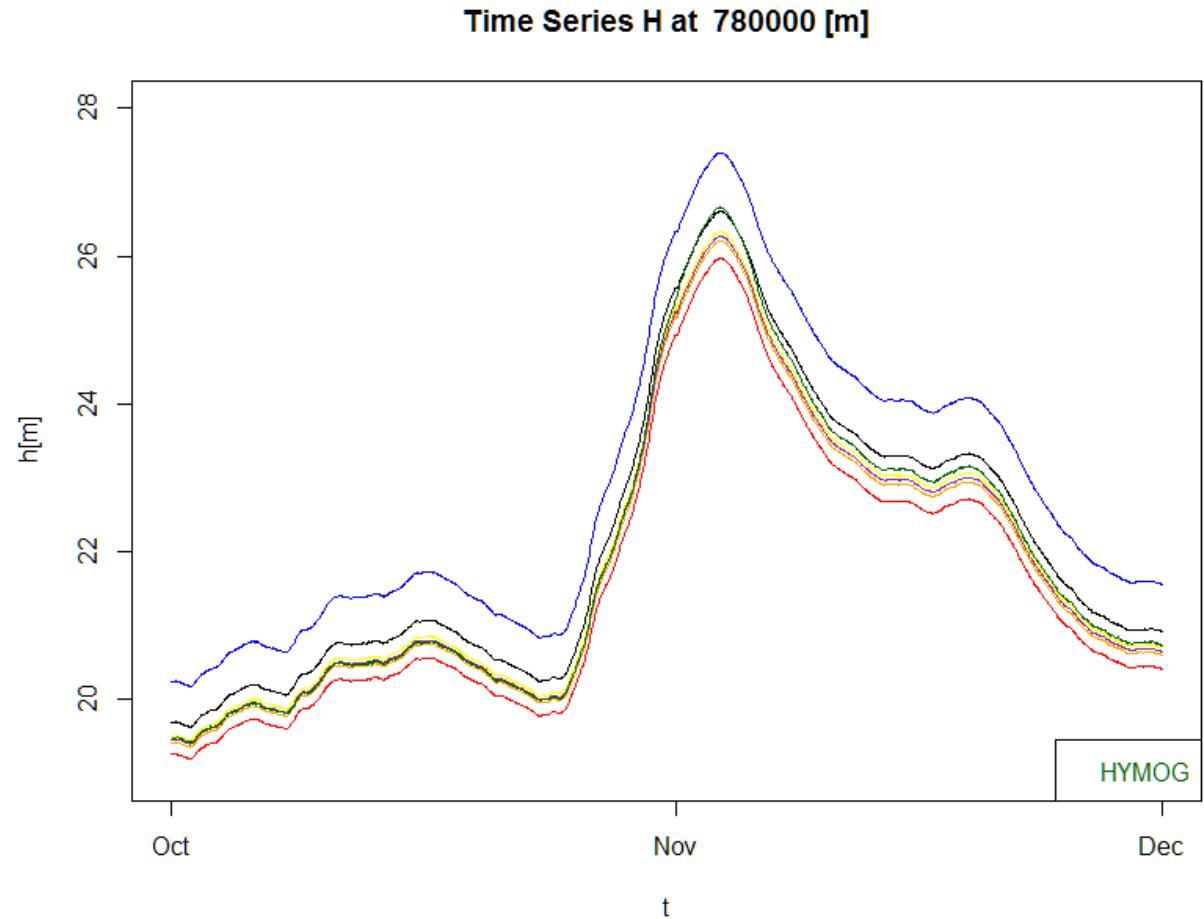

Nb.	HD result file	HD parameter
1	Result/1_HW98_525.res11	... Rhine_HDParameter_25.hd11
2	Result/2_HW98_535.res11	... Rhine_HDParameter_35.hd11
3	Result/3_HW98_530.res11	... Rhine_HDParameter_30.hd11
4	Result/4_HW98_532.res11	... Rhine_HDParameter_32.hd11
5	Result/5_HW98_533.res11	... Rhine_HDParameter_33.hd11
6	Result/6_HW98_532_5.res11	... Rhine_HDParameter_32_5.hd11

Model Calibration

Example Mike11

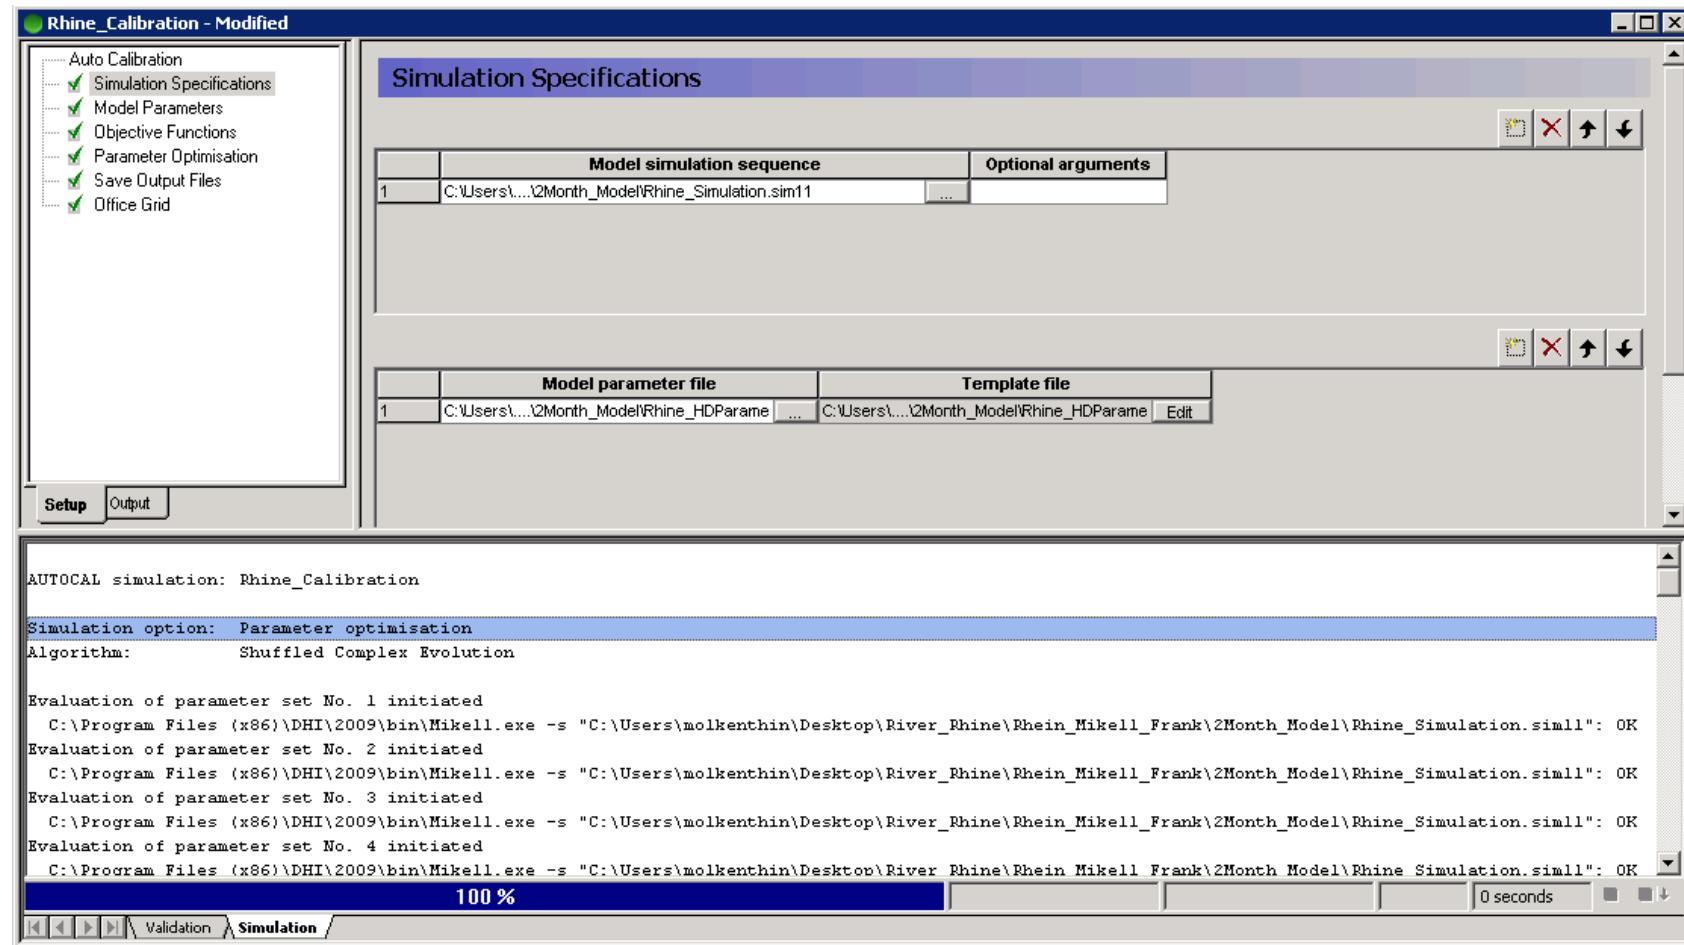

Ruhrort water level

for different
Strickler values

Model Calibration

Example Mike11 - Autocorrelation

Model Calibration

Example Mike11 - Autocorrelation

The screenshot shows two windows of the Rhine_Calibration software:

Model Parameters window:

ID value	Name	Parameter type	Initial value	Lower bound	Upper bound	Transformation	Equation	Keyword / Line no	Comment
1	1.01e-035	Strickler	Variable	25	10	40	Real	Rhine_HDPar	

Objective Functions window:

Evaluation period:

Name	Function type	Weight
rmse	Weighted sum of squares	1

Output measures:

Name	Output file	Item name	Target file	Item name	Statistic type	Weight below	Weight above	Function name
rmse	C:\Users\...\12Month_Mode\RHEIN; 8144		C:\Users\...\12Month_Mode\H_Ruhrort		RMSE	1	1	rmse

Model Calibration

Example Mike11 – Auto Calibration

Run #	Strickler	rmse	rsme
1	0.1155E+02	0.4226E+01	0.1786E+02

-

Model Evaluation

Strategy Model Evaluation

Application of Calibrated Model

1. analysis of available data for similar flood event
(e.g. ~HQ10 -> Jan 2003: 9482 m³/s)
2. choice of evaluation scenario
3. simulation run -> simulation result file
4. model evaluation (R Script -> result file -> evaluation criteria)
5. evaluation criteria satisfying
 - > yes evaluation okay
 - > no deeper analysis required
